 $\Gamma; \Phi \vdash e \Rightarrow \hat{\tau} \leadsto d \dashv \Delta$

$$\begin{array}{ll} \text{DEDefine} \\ \underline{\Phi_1 \vdash \tau_1 : \kappa \rhd \rho \dashv \Phi_2} & \Delta; \Gamma; \underline{\Phi_2 \vdash d : \tau_2} \\ \underline{\Delta; \Gamma; \Phi_1 \vdash \text{type} \ \rho = \tau_1 : \kappa \ \text{in} \ d : \tau_2} \end{array}$$

Theorem 1 (Well-Kinded Elaboration)

- (1) If $\Phi \vdash \hat{\tau} \Rightarrow \kappa \leadsto \tau \dashv \Delta \ then \ \Delta; \Phi \vdash \tau \Rightarrow \kappa$
- (2) If $\Phi \vdash \hat{\tau} \Leftarrow \kappa \leadsto \tau \dashv \Delta$ then Δ ; $\Phi \vdash \tau \Leftarrow \kappa$

This is like the Typed Elaboration theorem in the POPL19 paper.

Theorem 2 (Elaborability)

- (1) $\exists \Delta \ s.t. \ if \ \Delta; \Phi \vdash \tau \Rightarrow \kappa \ then \ \exists \hat{\tau} \ such \ that \ \Phi \vdash \hat{\tau} \Rightarrow \kappa \leadsto \tau \dashv \Delta$
- (2) $\exists \Delta \ s.t. \ if \ \Delta; \Phi \vdash \tau \Leftarrow \kappa \ then \ \exists \hat{\tau} \ such \ that \ \Phi \vdash \hat{\tau} \Leftarrow \kappa \leadsto \tau \dashv \Delta$

This is similar but a little different from Elaborability theorem in the POPL19 paper. Choose the Δ that is emitted from elaboration and then there's an $\hat{\tau}$ that elaborates to any of the τ forms. Elaborability and Well-Kinded Elaboration implies we can just rely on the elaboration forms for the premises of any rules that demand kind synthesis/analysis.

Theorem 3 (Type Elaboration Unicity)

- (1) If $\Phi \vdash \hat{\tau} \Rightarrow \kappa_1 \leadsto \tau_1 \dashv \Delta_1$ and $\Phi \vdash \hat{\tau} \Rightarrow \kappa_2 \leadsto \tau_2 \dashv \Delta_2$ then $\kappa_1 = \kappa_2$, $\tau_1 = \tau_2, \ \Delta_1 = \Delta_2$
- (2) If $\Phi \vdash \hat{\tau} \Leftarrow \kappa \leadsto \tau_1 \dashv \Delta_1$ and $\Phi \vdash \hat{\tau} \Leftarrow \kappa \leadsto \tau_2 \dashv \Delta_2$ then $\tau_1 = \tau_2$, $\Delta_1 = \Delta_2$

This is like the Elaboration Unicity theorem in the POPL19 paper.

Theorem 4 (Kind Synthesis Precision)

If
$$\Delta; \Phi \vdash \tau \Rightarrow \kappa_1 \text{ and } \Delta; \Phi \vdash \tau \Leftarrow \kappa_2 \text{ then } \Delta; \Phi \vdash \kappa_1 \lesssim \kappa_2$$

Kind Synthesis Precision says that synthesis finds the most precise kappa possible for a given input type. This is somewhat trivial, but interesting to note because it means we can expect singletons wherever possible.
